PRIOR ISSUES

Executive Summary

AI is shifting from an experimental tool to a regulator-recognized layer of drug development, with success hinging on validated data, governance, and clinical proof

1

A Maturing Market, Not Yet Consolidated

AI in drug development is projected to grow from ~\$6.5B (2026) to ~\$35.5B by 2035 at ~20.7% CAGR, but the market remains scattered. The top 5 vendors hold just ~11.8% share

2

Clinical Validation Is Emerging

AI-designed candidates are reaching late-stage trials: Insilico's rentosertib moved from target to preclinical candidate in 18 months and is now in Ph 3 in China with Breakthrough Therapy Designation

3

Capital Concentrates in Oncology

29.2B has been invested across 437 deals since 2021, led by oncology (177 deals), while Novartis, Bayer, and Daiichi Sankyo now deploy AI internally across discovery, safety, and trial design

4

Regulators Are Building the Rulebook

FDA and EMA jointly issued 10 Good AI Practice principles (Jan 2026), and FDA's new 7-step AI credibility framework signals governance is becoming a market-entry requirement

5

Integration Will Define the Winners

Advantage will favor players who combine proprietary data, validated models, and regulatory-ready governance across the full lifecycle, not point-solution algorithms alone

From Data to Discovery: The AI foundation of drug development

Objective: Establish a fundamental understanding of AI, its role across the drug-development lifecycle, and its potential to accelerate development

Introduction

AI's value is not simply speed, it is improving the quality and timing of development decisions

- AI in drug development refers to using advanced computational models to analyze complex data and support faster, smarter decisions across target discovery, molecule design, clinical development, and post-market monitoring
- **AI enables data-driven decision-making** across the drug-development lifecycle, from target identification to post-market monitoring
- **AI integrates complex datasets** to prioritize candidates, optimize clinical trials, improve patient selection, and reduce development risks
- **Beyond accelerating timelines, AI can improve decision quality and resource efficiency**, supported by robust data, validation, clinical oversight, and regulatory governance

Machine Learning

Deep Learning

Generative AI

Advanced Analytics

Where AI is transforming the lifecycle

AI acts across the pipeline, not a single point tool, but a connected layer of intelligence.

Why it matters

Faster Development

Accelerated timelines

Smarter Decisions

Data-driven insight

Lower R&D Costs

Efficient resource use

Higher Success Probability

Reduced attrition risk

AI Across Drug Development

From data to decisions across the drug-development lifecycle

AI is becoming a cross-functional decision-support layer across drug development, from target selection and molecule design to clinical development and post-market safety. Its near-term value lies in faster evidence analysis, broader data integration and more efficient R&D execution.

TARGET

Biological Data & Scientific Knowledge: AI integrates human genetics, single-cell and molecular data with published literature to prioritize disease-relevant targets

Evidence: Novartis used AI to analyze literature, human genetics and millions of single-cell experiments, identifying five ADPKD targets for further study

Disease Insight & Target Prioritization

DISCOVER

AI-Powered Molecule Design & Screening: Designs new molecules, predicts key properties and prioritizes the most promising compounds for laboratory testing

Evidence: Novartis used generative AI to design 15M potential compounds and evaluated ~60 in the laboratory in a molecular-glue project

Scalable Design & Faster Prioritization

PRE-CLINICAL

AI Safety & ADMET Prediction: Predicts toxicity, metabolic properties and other safety risks to prioritize experimental testing

Evidence: Novartis used AI-generated cardiac activity profiles to predict potential cardiac toxicity, then validated the predictions in the laboratory

Earlier Candidate Prioritisation

CLINICAL

AI-Enabled Trial Design & Patient Selection: Stratifies patients, predicts treatment response and optimizes trial design/site selection using clinical and multi-omics data

Evidence: Daiichi Sankyo and Tempus are developing multimodal AI models to optimize patient selection and map treatment response for an oncology ADC program

Improved Trial Efficiency

REGULATORY

AI-Assisted Regulatory Evidence: Produces and analyses information supporting regulatory decisions on drug safety, effectiveness and quality

Regulatory signal: FDA issued draft guidance in 2025; FDA and EMA jointly developed 10 Good AI Practice principles in 2026

Evidence-processing Efficiency

POST-MARKET

AI-Enabled Pharmacovigilance: Uses AI and machine learning to analyze real-world safety data and identify potential adverse-event signals

Evidence: Bayer's ML-based AE detection engine analyses high-volume, multi-channel safety reports to identify possible AEs and support pharmacovigilance reporting

Faster & Scalable Surveillance

Drug Development: The Traditional Path vs. the AI-Accelerated Journey

AI is reshaping the entire drug development lifecycle; accelerating timelines, enabling smarter decisions, and improving patient outcomes

AI Governance: From rules to readiness

Objective: Highlight the evolving regulatory framework and governance expectations for AI use across drug development

Regulating AI in Healthcare in Drug Development

EMA-FDA principles, reflection paper & upcoming regulations (2026-28)

A

EMA-FDA Good AI Practice Principles in Drug Development (2026)

WHY THIS IS IMPLEMENTED?

AI is being utilized more in drug development, requiring uniform regulatory oversight to ensure its safe, reliable, and transparent use for patient protection.

PURPOSE OF THIS IMPLEMENT?

Establishes common principles for the responsible AI development promoting risk-based validation, data quality, transparency, and international harmonization.

CURRENT UPDATES ON THIS ?

On 14 Jan 2026, EMA and FDA jointly **published 10 Good AI Practice (GAIP) principles** for the medicine's life cycle, establishing a shared EU-US foundation for future AI guidance and regulatory use of AI-generated evidence

Guiding Principles for AI in Drug Development

Human-centric
& Ethical AI

Risk-based
Validation

Compliance
With Standards

Clear Purpose
& Governance

Robust
Development &
Monitoring

B

EMA Reflection Paper on AI in the Medicinal Product Lifecycle

WHY THIS IS IMPLEMENTED?

Provides a framework for safe, responsible AI use in drug development, emphasizing reliability, transparency, scientific validity, and human oversight while addressing key risks such as bias, data quality, and cybersecurity.

PURPOSE OF THIS IMPLEMENT?

Guides pharmaceutical companies and regulators on the **responsible use of AI throughout the medicinal product lifecycle**, emphasizing human oversight, fit-for-purpose validation, and a clearly defined Context of Use (CoU).

CURRENT UPDATES ON THIS ?

EMA's active Reflection Paper sets risk-based expectations for responsible AI/ML use across the full medicines' lifecycle from discovery to post-authorisation. EMA is advancing its AI Strategy and Workplan, with the Reflection Paper serving as the scientific foundation.

AI Across The Medicinal Product Life Cycle

Drug
Discovery

Non-clinical

Pharmacovigilance

C

Upcoming Regulation: EMA-HMA NDSG Workplan 2026-2028

WHY THIS IS IMPLEMENTED?

The EMA and Heads of Medicines Agencies (HMA) introduced the updated Network Data Steering Group (NDSG) Workplan 2026-2028 to establish a coordinated approach to data, AI, and RWE across the EU medicines regulatory network

PURPOSE OF THIS IMPLEMENT?

Strengthen evidence generation, regulatory efficiency and decision-making for trusted human and veterinary medicines

CURRENT UPDATES ON THIS ?

The NDSG's updated Workplan (February 2026) is being implemented through 2028, with priorities including EU AI Act, advanced analytics, Data Analysis and Real-World Interrogation Network (DARWIN EU 2), AI guidance for clinical development, pharmacovigilance, data standards and international collaboration

Key Workplan Priorities (2026-2028)

AI Literacy
Training For
Regulators

Expansion of
Darwin EURD
Network

Alignment With
The EU AI Act

Greater Use Of RWE
& Advanced Data
Analytics

International
Collaboration

FDA's Evolving AI Regulatory Landscape

Overview of key documents, purpose, and current update

A

Considerations for the Use of Artificial Intelligence To Support Regulatory Decision-Making for Drug and Biological Products

Draft guidance, January 2025

WHY THIS IS IMPLEMENTED?

AI is increasingly being used in drug development, so FDA wants AI-generated evidence to be credible, transparent, and reliable.

PURPOSE OF THIS IMPLEMENT?

To provide a risk-based, 7-step framework for establishing and documenting the credibility of AI model outputs for a specific regulatory context of use

CURRENT UPDATES ON THIS ?

Issued as draft guidance in January 2025, it recommends risk-proportionate assessment, lifecycle maintenance to address data drift, and early FDA engagement on the AI model, context of use, and credibility plan

B

Using Artificial Intelligence & Machine Learning in the Development of Drug and Biological Products

Discussion Paper, Revised February 2025

WHY THIS IS IMPLEMENTED?

AI is rapidly expanding in drug development, so FDA issued this discussion paper to understand the opportunities, challenges, and regulatory needs before developing formal guidance.

PURPOSE OF THIS IMPLEMENT?

To collect stakeholder feedback on the responsible use of AI/ML in drug development and help shape future FDA guidance and policies.

CURRENT UPDATES ON THIS ?

The February 2025 revised discussion paper outlines AI/ML applications across discovery, clinical research, safety surveillance, and manufacturing, while seeking stakeholder feedback on data quality, reliability, model validation, monitoring, and lifecycle management

KEY TAKEAWAYS

The FDA's core guidance sets a risk-based framework with a 7-step AI credibility assessment, while its companion paper gathers stakeholder feedback to shape future AI/ML policy. Together, they aim to ensure AI use in drug development is credible, transparent, and well-governed.

From Innovation to Value: Mapping the AI Opportunity

Objective: Assess market growth, adoption, competitive dynamics, and investment activity shaping AI in drug development

Market Landscape

AI in drug development: Market size outlook, 2025-2035

MARKET SIZE (\$B)

\$35.5B

Projected market size by 2035

20.7%

CAGR, 2026 - 2035

Asia-Pacific

Fastest growing region, 2026 - 2035

KEY HIGHLIGHTS

- ❖ **Growth Drivers**
Oncology is the largest therapeutic area. North America leads on R&D spend; Asia-Pacific is the fastest-growing region
- ❖ **Pharma/biotech remain the principal customers**
Pharmaceutical and biotechnology companies are identified as leading end users across several market studies
- ❖ **Application leadership varies by definition**
Optimization/repurposing leads in some studies, while others identify de novo design or molecular-library screening as the largest application

KEY INSIGHTS

- ❖ **Software-led, but not uniform**
Software accounts for ~62-68% of the market in selected studies; however, the software services mix varies with market scope and definition
- ❖ **Provider landscape remains fragmented**
The supplier base spans specialized AI software, services and discovery platforms. The five leading vendors (Isomorphic Labs, Insitro, Insilico Medicine, Recursion and Schrodinger) collectively account for only ~11.8% of market share in one market assessment, indicating low market concentration
- ❖ **Data and validation remain key constraints**
Data fragmentation/interoperability, model interpretability, validation and cross-disciplinary talent remain important adoption challenges

From Innovation to Clinical Impact

Objective: Evaluate AI-enabled innovation, clinical validation, emerging technologies, and the evolving drug-development model

AI Tech Trends in Drug Development

The convergence of AI, quantum capabilities, and specialized hardware has transformed drug discovery from brute-force laboratory screening into targeted computational simulation.

Generative AI Systems & Software

Foundation Models for Biology: Domain-specific biological foundation models, such as Evo (Arc Institute) and AlphaFold 3 (DeepMind)

For generate novel DNA/protein sequences

Predicting biomolecular structures with ligands & nucleic acids

Diffusion & Generative AI: Tools like DiffDock and RFdiffusion design molecules for target binding, accelerating drug discovery.

For desiring de novo small molecules fitted to target binding pockets

Cutting screening time from years to delay

Quantum Computing Hardware & Hybrid Platforms

Quantum-Classical Hybrid Cloud Infrastructure

IBM Quantum and IonQ, integrated with cloud platforms, use VQE to model complex electronic structures beyond classical computing.

Quantum Generative AI (qGANs)

Quantum generative models can use fewer parameters than classical networks to generate more diverse, chemically accurate lead candidates.

Experimental Quantum Process Models

Fewer Parameters than Classical Networks

More Diverse Chemically Accurate Lead Structures

Edge Computing & Smart Lab Systems

High-Throughput Edge AI Hardware: Specialized edge AI accelerators (Nvidia Jetson, Google Coral) integrated directly into laboratory hardware such as Automated High-Throughput Screening (HTS) rigs and Cryo-Electron Microscopes (Cryo-EM) process raw spatial data locally.

Real-time Closed-loop Robotics: Edge nodes analyze real-time imaging or bio-assay outputs instantly to instruct robotic pipetting stations on next-step experiments without high-latency cloud roundtrips.

Nature Medicine Publishes a Phase IIa Data on Rentosertib

naturemedicine

Article | [Open access](#) | Published: 03 June 2025

A generative AI-discovered TNIK inhibitor for idiopathic pulmonary fibrosis: a randomized phase 2a trial

Zuolin Xu¹, Feng Ren, Ping Wang, Jie Cao, Chunting Tan, Dedong Ma, Li Zhao, Jinghong Dai, Yipeng Ding, Haohui Fang, Huiping Li, Hong Liu, Fengming Luo, Ying Meng, Pinhua Pan, Pingchao Xiang, Zuke Xiao, Suilata Rao, Carol Sattler, Sang Liu, Yuan Lv, Heng Zhao, Shan Chen, Hui Cui, ... Alex Zhavoronkov

Rentosertib (INS018-055/ISM001-055) is an investigational oral **TNIK inhibitor** for idiopathic pulmonary fibrosis (IPF), discovered and designed by **Insilico Medicine** using its AI-powered **Pharma.AI platform**, including **PandaOmics** for target discovery and **Chemistry42** for generative drug design

2019

PandaOmics flags TNIK from IPF multi-omics data

2022-23

Ph 1 completed and received ODD from US FDA

2025

Received BTD from China

2021

- Candidate nominated: INS018_055
- Ph 0 initiated microdose study (Australia)

2023-24

Ph 2a GENESIS-IPF completed in 21 sites of China

2026

Ph 3 initiated in China

Year	Development milestone	AI platform used	How AI contributed
2019	Analyzed IPF/fibrosis data and identified TNIK as a potential antifibrotic drug target	PandaOmics within Pharma.AI	PandaOmics analyzed IPF multi-omics, biological networks and scientific literature, ranking TNIK as the leading kinase target
2020	Generated and optimized novel TNIK inhibitors for potency, selectivity and drug-like properties	Chemistry42 within Pharma.AI	Chemistry42 used generative AI and predictive models to design TNIK inhibitors optimized for activity, ADME, solubility, stability and synthetic feasibility
2021	Final preclinical candidate nominated: INS018_055, later named rentosertib	Pharma.AI: PandaOmics + Chemistry42	PandaOmics identified TNIK, while Chemistry42 designed and optimized the molecule; 79 compounds were synthesized and tested, leading to candidate nomination within ~18 months
2023-24	Ph 2a was completed at 21 Chinese sites, enrolling 71 patients across placebo and three rentosertib dose groups	PandaOmics supported exploratory biomarker analysis	PandaOmics analyzed gene-expression data and fibrosis biomarkers
2025	China CDE Breakthrough Therapy Designation (May); Ph 2a results published in Nature Medicine (June)	PandaOmics used for biomarker/context analysis	PandaOmics supported gene-expression and biomarker analyses to contextualize fibrosis biology

From Competitive Signals to Strategic Advantage

Objective: Map the competitive landscape, technology capabilities, funding activity, and strategic implications for AI-enabled drug development

AI in Drug Development: The big picture

From Discovery to Delivery: Mapping the AI innovators

AI is evolving beyond drug discovery to enable the entire pharma value chain from target identification and development to clinical trials and operations. The leading players differentiate through proprietary data, real world experimental validation, and deep integration into clinical and operational workflows.

Capability Trends in AI-Enabled Drug Development

HUMAN SKILL TRANSFORMATION

Rise of the “TechBio” Scientist

The traditional boundary between bench wet-lab scientists and dry-lab computational chemists has collapsed. Organizations prioritize professionals proficient in both molecular biology/medicinal chemistry and Python, PyTorch, or Jax.

Quantum Chemistry Programming

Biopharma computational teams are upskilling in quantum software development kits (e.g., Qiskit, PennyLane) to prepare classical datasets for hybrid quantum workflows.

AI Model Validation Capability

Teams are developing capabilities to audit generative models for biological feasibility, synthesizability, and toxico-genomic risks, moving past treat-as-black-box approaches.

ENTERPRISE & STRUCTURAL READINESS

FAIR Data Operations

Large pharmaceutical firms are restructuring legacy clinical and multi-omics databases into standardized, machine-readable formats.

Without clean, internal data, generative models produce hallucinated or non-synthesizable candidates.

Self-Driving Labs (Lab Automation)

Structural readiness increasingly means connecting generative AI software directly to automated synthesis units via edge architectures.

Regulatory Compliance Frameworks

Companies are establishing internal safety protocols to align with evolving regulatory frameworks (such as FDA guidelines on AI/ML-based drug development) to ensure full trace-and-audit capability for AI-generated drug candidates.

Ensure safety, traceability, and auditability from model to molecule.

KEY TAKEAWAYS

AI-enabled drug discovery requires hybrid “TechBio” talent, quantum expertise, and strong AI validation capabilities. Success depends on FAIR data, automated labs, real-time feedback, and robust regulatory compliance.

Funding Dashboard(2021-2025)

KEY HIGHLIGHTS

- ❖ 2021 was the peak funding year at ~\$8.09B, nearly double the 2023 low of ~\$3.14B, funding dipped through 2022-2023 before partially recovering to ~\$5.3-5.67B in 2024-2025, reflecting the broader biotech funding slowdown followed by renewed AI-driven investor interest
- ❖ Top 5 companies raised ~\$7B (24% of total funding), with Altos Labs leading at \$3.27B. On the investor side, Alexandria Venture Investments was the most active repeat investor, funding early rounds (Seed/Series A) for companies like Mirador Therapeutics, Orbital Therapeutics and later-stage rounds (Series B/C) for companies like Insitro & Immuni
- ❖ Early-to-growth stage rounds dominate capital deployment, Series A & Series B alone account for ~42% of total funding. Cancer leads therapeutic focus by far with 177 deals showing AI-driven investment is heavily concentrated in oncology

GLOBAL DEAL VALUE BY REGION

The Road Ahead: The next frontier of AI in drug development

Objective: The key trends and strategic shifts expected to shape the next phase of AI adoption across the drug development lifecycle

Future Outlook:

Where AI in Drug Discovery is Heading

1

AI WILL ACCELERATE TARGET & MOLECULE DISCOVERY

AI will accelerate target and drug candidate discovery. It will prioritize high-potential candidates using AI-driven biological insights.

Reduces early-stage discovery time and resource requirements.

2

MULTIMODAL AI WILL BUILD A MORE COMPLETE VIEW OF DISEASE BIOLOGY

AI will integrate multi-omics, structural, chemical, and clinical data. This will enable a more comprehensive view of disease biology and drug discovery.

Better evidence-based target selection and more informed decisions.

3

AI + AUTOMATION WILL ENABLE CLOSED-LOOP DISCOVERY

AI, robotics, and automation will enable a continuous Design → Test → Learn → Redesign cycle. This will accelerate experimentation and optimize drug candidates more efficiently.

Faster iteration, higher productivity, and deeper exploration.

4

AI WILL EXPAND FROM DISCOVERY TO THE FULL DRUG-DEVELOPMENT LIFECYCLE

AI will expand across the drug-development lifecycle, from preclinical research to post-market safety. Regulators are establishing frameworks for responsible, risk-based AI adoption.

Broader impact across the entire drug-development lifecycle.

5

HUMAN EXPERTISE + AI WILL DEFINE THE FUTURE OPERATING MODEL

AI will augment not replace scientists by handling data analysis, prediction, & repetitive tasks. Scientists will drive biological interpretation, experimentation, & strategic decisions.

Competitive advantage comes from combining AI, data, and expertise.

6

VALIDATION, TRANSLATION & REGULATORY READINESS WILL BECOME KEY DIFFERENTIATORS

AI adoption will shift from benchmark performance to real-world drug-development impact. Focus will be on clinical translation, better decisions, and responsible AI frameworks.

Validated models, strong governance, and transparent workflows drive scalable adoption.

ABOUT COMPANY

Research & Intelligence that Proves our ROI

Competitive Intelligence & Monitoring

- Real-time CI monitoring
- Strategic early warning
- War-gaming & Simulation workshops
- Conference coverage
- Trial Optimization Strategy
- Digital Biomarker Strategy
- Competitor Promotion tracking

Portfolio & Commercial Strategy

- Opportunity Scanning
- Portfolio Strategy & Asset Prioritization
- Brand positioning
- Peak Sales Forecasting
- Digital therapeutic evaluation
- Innovation pipeline screening

Business Development & Licensing

- Target identification and validation
- Retrospective deal analysis
- Synergy assessment
- M&A due diligence
- Digital health and innovation advisory

Market Access & Evidence

- Payer landscape mapping
- Value dossier support
- RWE strategy design
- Pricing and reimbursement roadmaps
- RWE Analysis
- Medical Insights Research
- KOL identification and mapping
- KOL Engagement strategy

Medical Affairs & Analytics

- HCP & Patient insights
- Field force analysis
- Forecasting
- Integrated data analytics
- Patient journey mapping & analytics
- Patient Advocacy mapping
- Content Strategy
- Digital Sentiment analysis

Capabilities are configured to fit the decision, asset stage and timeline.
